NORTHBRIDGE RISK PARTNERS · CLIENT 360

# One client. One number. Governed.

A single, governed client master for a global broker after the Harbor & Cole acquisition — built on Databricks in weeks, not a multi-year CRM migration.

Richa Sethi · Delivery Solutions Architect, Databricks · October 2026

THE OUTCOME

# About $6.9M a year of revenue protected, recovered and grown — from one client view

## $89.8M

**relationship revenue across 75 client groups served by *both* books**

now visible as one relationship

## $11.3M

**FY2025 commission flagged across 371 placements**

short-paid or missing from carrier statements

## 1.4%

**of match decisions need a human (51 of 3,661)**

2,405 duplicate records resolved automatically

## to the cent

**Kestrel FY2025: $3,835,598.67**

same in the app, Genie and finance's metric view

Synthetic book of 829 client groups, $474.5M FY2025 fee & commission income. Value case and assumptions on slide 8.

THE PROBLEM

# Kestrel Industries exists 6 times in 4 systems, and nobody can say what it's worth

| | |
|---|---|
| HARBOR & COLE | KESTREL INDS PLC |
| HARBOR & COLE | KESTREL INDUSTRIES PLC |
| NB BILLING Company | Kestrel Industries Public Limited |
| NB CRM | Kestrel Industries PLC |
| NB CRM | Kestrel Industries plc |
| PLACEMENT | Kestrel Industries plc |

The same client, as held today. One H&C record has a transposed registration number; one CRM duplicate has none.

## What that costs

- **Renewals at risk.** Two account teams pitch the same CFO without knowing it.
- **Cross-sell missed.** Harbor & Cole clients never see Northbridge specialty lines.
- **Revenue leaks.** Carrier statements cannot be matched to the client who was billed.
- **Compliance exposure.** Defence & government clients copied into every system and spreadsheet.
- **Integration stalls.** "Wait for the CRM migration" is a two-year answer.

WHO WINS

# What each buyer is measured on, and how this moves it

### EXECUTIVE SPONSOR · CFO (WITH THE CHIEF CLIENT OFFICER)

- **Organic revenue growth:** +0.7 pts from renewal retention and cross-sell ($3.5M)
- **Adjusted EBITDA margin:** +72 bps from recovered carrier commission ($3.4M, no added cost to serve)
- **Acquisition synergy capture** against the Harbor & Cole deal case, reported to the board
- **One SOX-tagged revenue number** finance signs, tied out to the cent

### DOMAIN OWNER · HEAD OF CLIENT DATA & GOVERNANCE

- Duplicate rate and time-to-resolve, with 51 reviews instead of 3,661
- Steward throughput with an AI second opinion on every hard case
- Restricted-client access enforced by policy, provably
- Lineage from every number back to the source record

> One shared measure: certified total relationship revenue per client, the number both of them report.

WHAT I'LL SHOW

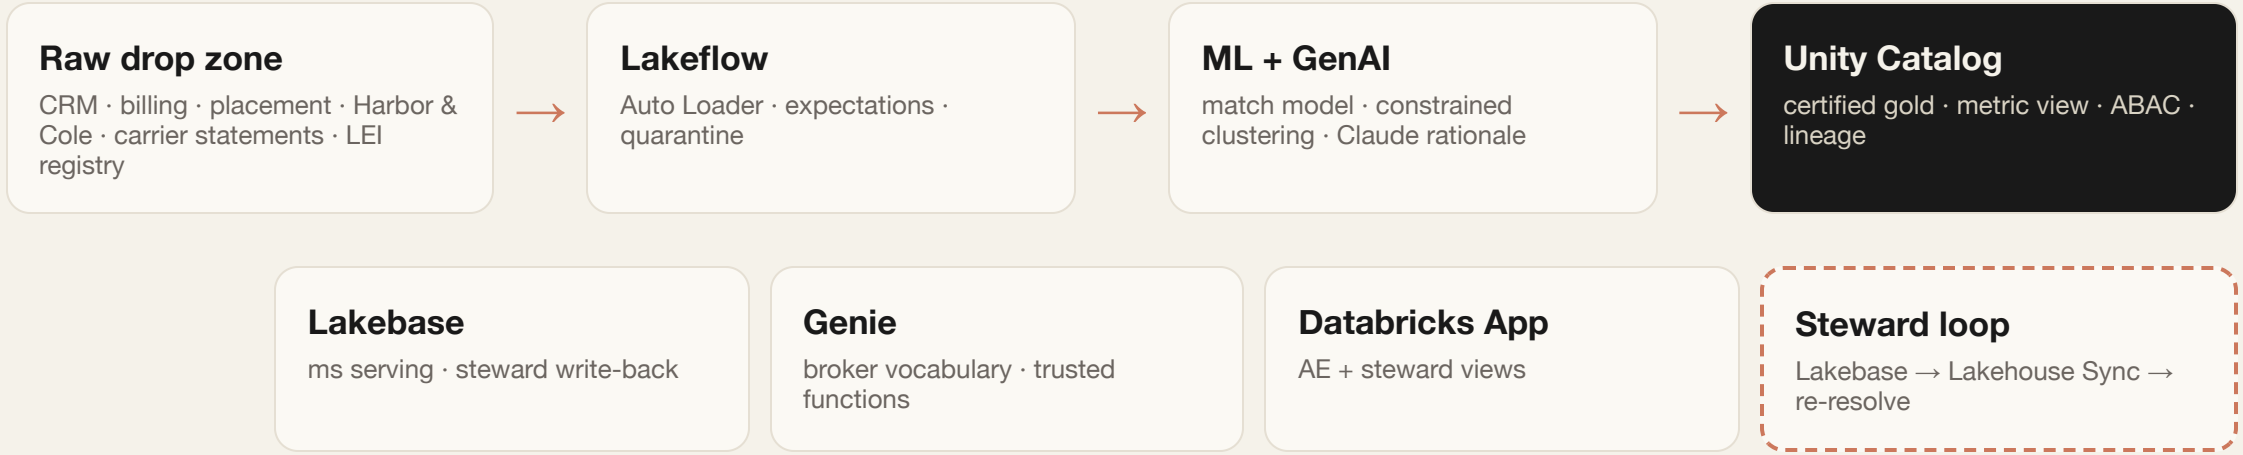

# Four moments, twelve minutes

1. **The account executive** searches Kestrel and gets one golden record, the legal-entity tree and revenue rolled up to the parent, in milliseconds.
2. **The question in plain English.** Genie answers "which Harbor & Cole clients overlap ours?" with the same certified numbers.
3. **The steward.** An ambiguous match, the model's score and the AI's reasoning. Approve it, and watch the golden record change.
4. **The guardrail.** Remove someone's entitlement and the restricted clients disappear everywhere, by policy.

> Everything you'll see is live: one workspace, deployed from one bundle, on serverless.

THE JOURNEY

# Raw data to business app on one governed platform

> Integrated, not stitched: a steward's click in the app becomes the next run's override, with no custom sync code.

LIVE DEMO

# Let's look at it running

1. **Account executive:** Kestrel, one golden record, hierarchy, revenue
2. **Genie:** total relationship and Harbor & Cole overlap, in plain English
3. **Data steward:** an ambiguous match, Claude's reasoning, approve
4. **Guardrail:** restricted clients governed by policy

northbridge-client360-7474655101081776.aws.databricksapps.com

THE VALUE CASE

# $6.9M a year on a $474.5M book: about 1.5% of fee & commission income

| LEVER | MEASURED IN THE BUILD | ASSUMPTION | ANNUAL VALUE |
|---|---|---|---|
| Protect overlapping relationships at renewal | 75 groups · $89.8M FY2025 | +2% retention | $1.8M |
| Cross-sell into Harbor & Cole-only clients | 224 groups · $34.5M | +5% wallet share | $1.7M |
| Recover commission leakage | 371 placements · $11.3M flagged | 30% recovered | $3.4M |
| Steward effort on duplicates | 2,405 merges automated | 10 min per manual merge | ~401 hours / cycle |
| **Revenue impact (first three levers)** | | | $6.9M |
| **In the CFO's metrics:** organic revenue growth (retention + cross-sell) · adjusted EBITDA margin (recovered commission) | | | +0.7 pts · +72 bps |

Measured figures come from the running build (evidence/10_value_inputs.md). Assumptions are deliberately conservative and should be replaced with Northbridge's own renewal and recovery rates in the pilot.

TRUST

# One definition of revenue, enforced by policy

SAME NUMBER EVERYWHERE

## $3,835,598.67

Kestrel FY2025 in the app, in Genie and in finance's certified metric view: one definition, fee + commission, never premium.

RESTRICTED CLIENTS, BY ATTRIBUTE

Entitled user sees **51** restricted entities. Remove the entitlement: **0**, in SQL, dashboards and Genie, within minutes.

51 defence & government entities ($16.4M FY2025) are governed by two tag-driven ABAC policies, and never copied to the operational store.

> Governance isn't a separate project: tag the data once and every tool, from SQL to Genie to the app, obeys.

THE OPERATIONAL LOOP

# A steward's decision reaches the lakehouse in ~13 seconds

1

**Approve** in the app

row written to Lakebase Postgres

2

**Lakehouse Sync**

CDC into Unity Catalog in ~13 s

3

**Re-resolve**

entity resolution applies the override

4

**Rebuild**

certified gold and the metric view

5

**Serve**

Lakebase refreshes; the AE sees it in ~25 ms

> Measured: one approval merged two duplicate records of MERIDIAN NORTH ENG. GERMANY AG (HC_AMS) into one golden party.

THE GOLDEN RECORD

# 100.0% precision, 98.2% recall, and humans only on the hard 51

**4,267**
**source client records**

**1,862**
**golden parties**

**8**
**Kestrel legal entities, one tree**

- Blocking on registration number, name + country, phonetics and postcode
- Gradient-boosted match model, registered in Unity Catalog
- Cannot-link rules: one country and one registration number per legal entity
- Hierarchy from the LEI-style registry and CRM parent links

CLAUDE, ON TAMWORTH NORTH RESOURCES TRADING S.R.L. VS TAMWORTH NORTH RESOURCES TRADING SRL

"Names are identical after normalising case and suffix (S.R.L.=Srl); same country (IT). No conflicting registration (A has none). Differing addresses consistent with branch/legacy systems."

RECOMMENDATION: MERGE · THE STEWARD DECIDES

DECISIONS AND TRADE-OFFS

# Why this design, and what we chose not to do

| DECISION | WHY | TRADE-OFF |
|---|---|---|
| Governed layer above the sources | Value now; no source system has to win | Sources stay messy; we standardise downstream |
| Explainable GBM + LLM for the grey zone | Auditable features; AI only where it adds judgement | Needs labelled history to start (stewards supply it) |
| ABAC on tags, not per-table filters | New tables governed by tagging | Relies on tagging discipline |
| Restricted clients stay in the lakehouse | Lakebase cannot sync policy-protected tables; data minimisation | Restricted views query the warehouse (~3 s, not ms) |
| Snapshot sync to Lakebase | Small tables, simple, consistent | Minutes, not seconds, to refresh; move to continuous at scale |

HOW IT WAS BUILT

# AI as the force multiplier; a human owned every decision

### THE WORKFLOW

- **Claude Code** (Claude Opus 5.5) in the terminal, with the Databricks plugin skills: core, pipelines, DABs, Lakebase, Genie, metric views, apps
- **Human checkpoints:** catalog, ABAC over per-table filters, the Lakebase serving design, UX feedback
- **AI did the build, tests and evidence;** an AI code-review agent challenged it
- One working session, one bundle, rebuilt from an empty catalog to verify

### WHERE IT MULTIPLIED

- **Probe before design:** five platform limits found in the workspace before code depended on them
- **Ground truth from day one:** labels caught a party-id collision (830 false merges to 0)
- **Prompts tuned on evidence:** the steward prompt went from 91% "needs info" to decisive v2
- **Adversarial review:** 10 real defects found, fixed, re-verified
- **Evidence as code:** every number on these slides is a live query

> The same workflow runs the pilot: the AI builds and measures, Northbridge's people make the calls.

TIME TO VALUE

# A six-week pilot on Northbridge's own data

**Weeks 1–2**

Connect CRM, billing and the H&C AMS with Lakeflow Connect; land carrier statements

**Weeks 3–4**

Tune the match model on stewards' labels; certify the revenue metric with finance

**Weeks 5–6**

Client 360 to 20 account executives; Genie to finance and placement

## Success criteria

- ≥ 98% merge precision on a steward-audited sample
- Total relationship revenue ties to finance to the dollar
- Overlap and leakage worklists in AEs' and finance's hands
- Restricted-segment access proven by audit

> No infrastructure project: the pilot is about Northbridge's data and rules, and the first value lands in week four.

WHAT'S NEXT

# From pilot to production: make the AI accountable

### 1 · JUDGE THE AI

An LLM-judge pass scores Claude's merge / keep-separate advice against the steward's eventual decision. Agreement rate is trended per prompt version in MLflow, and prompt changes ship only if it holds.

### 2 · WATCH FOR DRIFT

Each run compares the match-score distribution and the review-band share with the last. When the band drifts past a threshold, a job condition retrains on steward labels and promotes a challenger to *champion* only if it wins.

### 3 · STEWARD ACTION PLANS

The Foundation Model writes a narrative case for a batch, e.g. a whole corporate family, grounded in certified gold (hierarchy, revenue, placements) and logged like pair assessments. Stewards approve a family, not one pair at a time.

> Each step extends what's already running: steward decisions, the ER run log and the champion model alias.

# Start the six-week pilot

- Executive sponsor and a named domain owner
- Read access to CRM, billing and the Harbor & Cole AMS
- Two data stewards, two hours a week
- A finance owner for the revenue definition

Outcome in six weeks: one governed view of every client, and a worked value case on Northbridge's own numbers.

QUESTIONS WE EXPECT

# Cost, risk and integration

### BUSINESS

- **"We already have an MDM programme."** This feeds it: a governed golden record and steward workflow today, published to any MDM later.
- **"What does it cost?"** Serverless, pay per use; the pilot scope is a small fraction of one value lever.
- **"Can we trust automatic merges?"** Every merge has a confidence, a lineage trail and a steward override.

### TECHNICAL

- **Scale.** Blocking keeps comparisons near-linear; featurisation moves to Spark UDFs beyond ~1M records.
- **Integration.** Lakeflow Connect for Salesforce / SQL Server; the golden record syncs back to operational systems.
- **Security.** ABAC, on-behalf-of-user app and Genie access, service principal reads gold only.

> Every answer on this slide is demonstrated in the running build, not promised.

APPENDIX

# Evidence and what is synthetic

## Execution evidence (text, in the repo)

- 00 · from-scratch teardown and build logs
- 01 · build job tasks + notebook outputs
- 02 · expectations and quarantine
- 03 · entity resolution and MLflow
- 04 · ABAC policies, tags, toggle test
- 05 · lineage to all four systems
- 06–07 · Lakebase and app selftest
- 08 · five Genie questions vs ground truth
- 09 · steward round trip
- 10 · value inputs

## Real vs synthetic

Every pipeline, model, policy, synced table, Genie space and the app is real and running. All companies, people, registration numbers, carriers and amounts are generated (fixed seed). Training labels stand in for a steward-labelled match history. No customer data.
